Personal Statement

All my high school life, I have always aspired to join one of the world class college that mold students into responsible citizens. Given the opportunity, I intend to major my studies in the field of Agricultural Science so that I become one of the most recognized agriculturalists in the society. I hope to get academic skills and experiences that would equip me with necessary knowledge to deal with the problems witnessed in the contemporary society especially in regard to food shortage, unhealthy feeding, and unsustainable farming. I do not intend to just become academically empowered, but to also get to have an encounter with students from different backgrounds all over the world.

Getting this scholarship will be like a dream come true. I notice my passion for an Agriculture course while in lower grade school. I have had special interest in the agriculture subject and always perform better compared to other subjects like sciences. I am currently doing a lot of research and studies concerning the subject to further enhance my knowledge on the career choice. While at home, during weekends, I do watch a lot of agricultural programs that include different sustainable farming methods used in desert and saline areas where water is scarce. I am also participating in various school symposiums and functions relating to Agriculture. In addition, I am part of the school's Agriculture club; we do a lot of farming within the school and learn a lot as far as farming is concerned. I believe that my current interest in the field will help me learn more about the course when I get the scholarship opportunity.

I believe that college experience will give me more insight on the academic and career choices. I will get the opportunity to study animal and food science including sustainable farming practices. I will get to learn how crops and animal engineering is done in order to create more drought and pest resistant breeds. Apart from the academic experience, I will get to meet different professors who will also impact my experience. With the help of the lecturers I plan to conduct research on how animal breeding can enhance genetic constitution; this will be very important for my career as it will serve as a platform to prove my efficiency in the field of Agriculture. The scholarship will provide me with the chance to meet students from different backgrounds; I will be able to share my interests and experiences with them as I learn from them too.

With the chance to pursue my dream, I hope to leave college with a mind ready to transform the world. Since society is currently in a worse state in terms of food provision, my inventions will help come up with proper measure to improve food security in both developed and developing nations. I will be able to help my society embrace economical, productive farming techniques that will not only save the environment from depletion, but will also provide them with profitable produce. By getting a scholarship and pursuing my dream, I will be able to serve as an example to many other youths who are in the society that still do not believe in education and quality careers.
